Question **1**

Correct

Marked out of  
3.00

[Flag question](#)

Write a program to read two integer values and print true if both the numbers end with the same digit, otherwise print false. Example: If 698 and 768 are given, program should print true as they both end with 8. Sample Input 1 25 53 Sample Output 1 false Sample Input 2 27 77 Sample Output 2 true

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main()
3 {
4     int a,b;
5     scanf("%d%d",&a,&b);
6     if(a%10==b%10)
7         printf("true");
8     else
9         printf("false");
10    return 0;
11 }
```

|   | Input | Expected | Got   |   |
|---|-------|----------|-------|---|
| ✓ | 25 53 | false    | false | ✓ |
| ✓ | 27 77 | true     | true  | ✓ |

Question **2**

Correct

Marked out of  
5.00

🚩 [Flag question](#)

**Objective**

In this challenge, we're getting started with conditional statements.

**Task**

Given an integer, ***n***, perform the following conditional actions:

- If ***n*** is odd, print **Weird**
- If ***n*** is even and in the inclusive range of **2** to **5**, print **Not Weird**
- If ***n*** is even and in the inclusive range of **6** to **20**, print **Weird**
- If ***n*** is even and greater than **20**, print **Not Weird**

Complete the stub code provided in your editor to print whether or not ***n*** is weird.

A single line containing a positive integer, ***n***.

**Constraints**

·       $1 \leq n \leq 100$

**Output Format**

Print Weird if the number is weird; otherwise, print Not Weird.

**Sample Input 0**

3

**Sample Output 0**

Weird

**Sample Input 1**

24

**Sample Output 1**

## Explanation

*Sample Case 0:  $n = 3$*

$n$  is odd and odd numbers are weird, so we print **Weird**.

*Sample Case 1:  $n = 24$*

$n > 20$  and  $n$  is even, so it isn't weird. Thus, we print **Not Weird**.

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main()
3 {
4     int n;
5     scanf("%d",&n);
6     if(n%2==0&& n>=2&& n<=5)
7         printf("Not Weird");
8     else if(n%2!=0)
9         printf("Weird");
10    else if(n%2==0&& n<=20&& n>=6)
11        printf("Not Weird");
12    else
13        printf("Not Weird");
14    return 0;
15 }
```

|   |    |           |           |   |
|---|----|-----------|-----------|---|
| ✓ | 3  | Weird     | Weird     | ✓ |
| ✓ | 24 | Not Weird | Not Weird | ✓ |

Question **3**

Correct

Marked out of  
7.00

🚩 [Flag question](#)

Three numbers form a Pythagorean triple if the sum of squares of two numbers is equal to the square of the third. For example, 3, 5 and 4 form a Pythagorean triple, since  $3*3 + 4*4 = 25 = 5*5$ . You are given three integers, a, b, and c. They need not be given in increasing order. If they form a Pythagorean triple, then print "yes", otherwise, print "no". Please note that the output message is in small letters. Sample Input 1 3 5 4 Sample Output 1 yes Sample Input 2 5 8 2 Sample Output 2 no

**Answer:** (penalty regime: 0 %)

```

1  #include<stdio.h>
2  int main()
3  {
4      int a,b,c;
5      scanf("%d%d%d",&a,&b,&c);
6      if((a*a+b*b==c*c) || (b*b+c*c==a*a) || (a*a+c*c==b*b))
7          printf("yes");
8      else
9          printf("no");
10     return 0;
11 }
```

|   | Input | Expected | Got |   |
|---|-------|----------|-----|---|
| ✓ | 3     | yes      | yes | ✓ |
|   | 5     |          |     |   |
|   | 4     |          |     |   |
| ✓ | 5     | no       | no  | ✓ |
|   | 8     |          |     |   |
|   | 2     |          |     |   |
