GE23131-Programming Using C-2024

Question **1**

Correct

Marked out of 3.00

▼ Flag question

A set of N numbers (separated by one space) is passed as input to the program. The program must identify the count of numbers where the number is odd number.

Input Format:

The first line will contain the N numbers separated by one space.

Boundary Conditions:

The value of the numbers can be from -99999999 to 99999999

Output Format:

The count of numbers where the numbers are odd numbers.

Input:

5 10 15 20 25 30 35 40 45 50

Output:

5

Explanation:

The numbers meeting the criteria are 5, 15, 25, 35, 45.

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
 2
   int main()
 3 ▼ {
        int n,x=0;
        while(scanf("%d",&n)==1)
 6 🔻
            if (n%2!=0)
 8 •
 9
                x++;
10
11
         printf("%d",x);
12
         return 0;
13
14
15
```

Question **2**

Correct

Marked out of 5.00

Flag question

Given a number N, return true if and only if it is a *confusing number*, which satisfies the following condition:

We can rotate digits by 180 degrees to form new digits. When 0, 1, 6, 8, 9 are rotated 180 degrees, they become 0, 1, 9, 8, 6 respectively. When 2, 3, 4, 5 and 7 are rotated 180 degrees, they become invalid. A *confusing number* is a number that when rotated 180 degrees becomes a **different** number with each digit valid.

Example 1:

6 -> 9

Input: 6

Output: true

Explanation:

We get 9 after rotating 6, 9 is a valid number and 9!=6.

Input: 89

Output: true

Explanation:

We get 68 after rotating 89, 86 is a valid number and 86!=89.

Example 3:

11 -> 11

Input: 11

Output: false

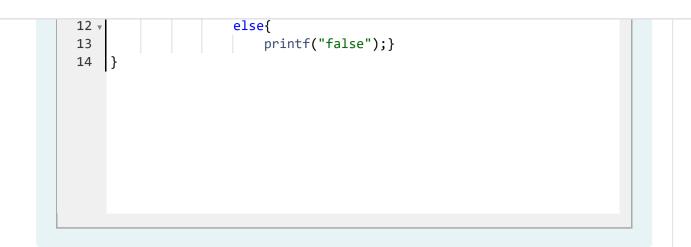

Explanation:

We get 11 after rotating 11, 11 is a valid number but the value remains the same, thus 11 is not a confusing number.

Note:

- 1. 0 <= N <= 10^9
- 2. After the rotation we can ignore leading zeros, for example if after rotation we have 0008 then this number is considered as just 8.

Answer: (penalty regime: 0 %)

	Input	Expected	Got	
~	6	true	true	~
~	89	true	true	~
~	25	false	false	~

Question **3**

Correct

Marked out of 7.00

Flag question

A nutritionist is labeling all the best power foods in the market. Every food item arranged in a single line, will have a value beginning from 1 and increasing by 1 for each, until all items have a value associated with them. An item's value is the same as the number of macronutrients it has. For example, food item with value 1 has 1 macronutrient, food item with value 2 has 2 macronutrients, and incrementing in this fashion.

The nutritionist has to recommend the best combination to patients, i.e. maximum total of macronutrients. However, the nutritionist must avoid prescribing a particular

macronutrients that can be prescribed to a patient, without the sum matching the given 'unhealthy' number.

Here's an illustration:

Given 4 food items (hence value: 1,2,3 and 4), and the unhealthy sum being 6 macronutrients, on choosing items 1, 2, 3 -> the sum is 6, which matches the 'unhealthy' sum. Hence, one of the three needs to be skipped. Thus, the best combination is from among:

$$2 + 3 + 4 = 9$$

$$1+3+4=8$$

$$1+2+4=7$$

Since 2 + 3 + 4 = 9, allows for maximum number of macronutrients, 9 is the right answer.

Complete the code in the editor below. It must return an integer that represents the maximum total of macronutrients, modulo $1000000007 (10^9 + 7)$.

It has the following:

n: an integer that denotes the number of food items

k: an integer that denotes the unhealthy number

Constraints

$$\cdot \qquad 1 \le n \le 2 \times 10^9$$

$$1 \le k \le 4 \times 10^{15}$$

The first line contains an integer, n, that denotes the number of food items.

The second line contains an integer, k, that denotes the unhealthy number.

Sample Input 0

2

2

Sample Output 0

3

Explanation 0

The following sequence of n = 2 food items:

- 1. Item 1 has 1 macronutrients.
- 2. 1 + 2 = 3; observe that this is the max total, and having avoided having exactly k = 2 macronutrients.

Sample Input 1

2

Sample Output 1					
2					
Explanation 1					
1. Cannot use item 1 because $k = 1$ and $sum \equiv k$ has to be avoided at any time.					
2. Hence, max total is achieved by $sum = 0 + 2 = 2$.					
Sample Case 2					
Sample Input For Custom Testing					
Sample Input 2

3					
Sample Output 2					
5					
Explanation 2					

Answer: (penalty regime: 0 %)

```
#include<stdio.h>
   int main()
2
 3 ▼ {
        long long int n,t,i,nut=0;
 4
        scanf("%11d %11d",&n,&t);
 5
        for(i=1;i<=n;i++){</pre>
            nut=nut+i;
            if (nut==t) {
 8 •
 9
                nut=nut-1;}}
                printf("%lld",nut%1000000007);
10
11
```

	Input	Expected	Got	
~	2	3	3	~
~	2	2	2	~
~	3	5	5	~
